

ABSTRACT OF THE DISCLOSURE

A computer for managing access of a user to resources having a first database for storing of users and/or of groups of users. One or more script files are generated containing information descriptive of a user resource. A centralized user manager program accesses the first database and the script file(s). A remote computer is coupled to the central computer. Included in the central computer is an application program for accessing a local user management program. The local user management program creates a local resources database for authentication and access right authentication of the user during the login procedure.
